tidyr

Functions for tidying data.

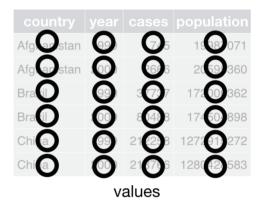

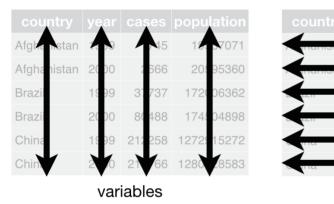

What is tidy data?

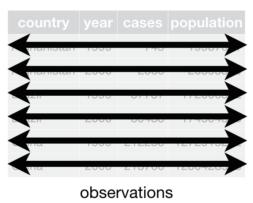

"Tidy datasets are all alike, but every messy dataset is messy in its own way." — Hadley Wickham

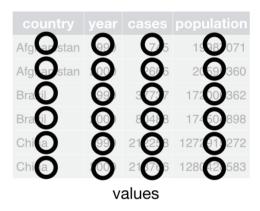

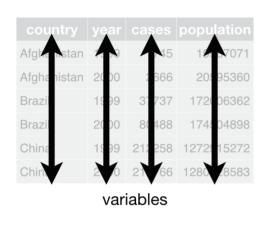

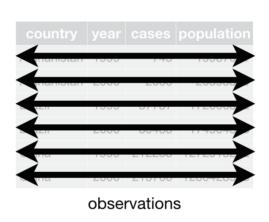

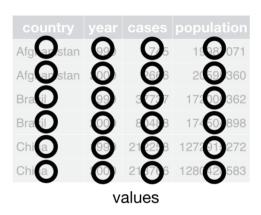

Each column is a single variable

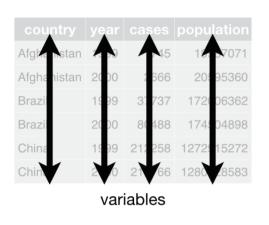

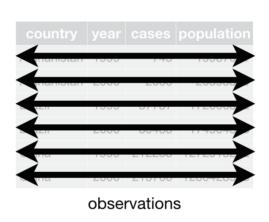

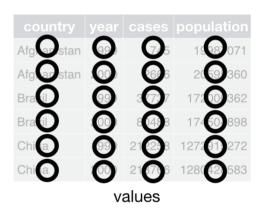

Each column is a single variable

Each row is a single observation

Each column is a single variable

Each row is a single observation

Each cell is a value

pivot_longer()

pivot_longer(<DATA>, <NAMES TO>, <VALUES TO>, <VARIABLES>)

new data alert!

Use pivot_longer() to reorganize table4a into three columns: country, year, and cases.

pivot_wider(<DATA>, <NAMES FROM>, <VALUES FROM>)

```
lotr %>%
  pivot_longer(
    names_to = "sex",
    values_to = "words",
    cols = female:male
) %>%
  pivot_wider(
    names_from = race,
    values_from = words
)
```

```
lotr %>%
  pivot_longer(
    names_to = "sex",
    values_to = "words",
    cols = female:male
) %>%

pivot_wider(
    names_from = race,
    values_from = words
)
```

```
lotr %>%
  pivot_longer(
    names_to = "sex",
    values_to = "words",
    cols = female:male
) %>%
  pivot_wider(
    names_from = race,
    values_from = words
)
```

<i>##</i>	#	A tibble: 6 × 5					
<i>##</i>		film	sex	Elf	Hobbit	Man	
<i>‡‡‡‡</i>		<chr></chr>	<chr></chr>	<int></int>	<int></int>	<int></int>	
<i>‡‡‡‡</i>	1	The Fellowship Of The Ring	female	1229	14	0

<i>‡‡‡</i>	6	The Return Of The King	male	510	2673	2459	20 / 40

Use pivot_wider() to reorganize table2 into four columns: country, year, cases, and population.

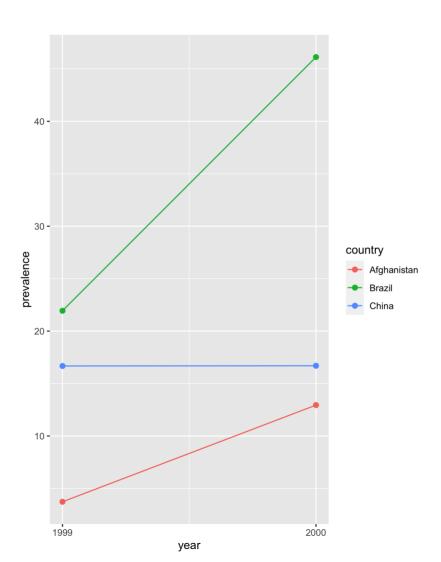

Create a new variable called prevalence that divides cases by population multiplied by 100000.

Pass the data frame to a ggplot. Make a scatter plot with year on the x axis and prevalence on the y axis. Set the color aesthetic (aes()) to country. Use size = 2 for the points. Add a line geom.

```
table2 %>%
  pivot_wider(
    names_from = type,
    values_from = count
) %>%
  mutate(prevalence = (cases / population) * 100000)
```

```
## # A tibble: 6 × 5
## country year cases population prevalence
4‡4‡
  <chr> <int> <int>
                            <int>
                                     <dbl>
## 1 Afghanistan 1999
                     745 19987071
                                    3.73
## 2 Afghanistan 2000 2666 20595360 12.9
## 3 Brazil
           1999 37737 172006362 21.9

                                     16.7
```

```
table2 %>%
  pivot_wider(
   names_from = type,
   values_from = count
) %>%
  mutate(prevalence = (cases / population) * 100000) %>%
  ggplot(aes(x = year, y = prevalence, color = country)) +
  geom_point(size = 2) +
  geom_line() +
  scale_x_continuous(breaks = c(1999L, 2000L))
```

Pivot the 5th through 60th columns of who so that the names of the columns go into a new variable called codes and the values go into a new variable called n. Then select just the country, year, codes and n variables.

who

```
who %>%
  pivot_longer(
    names_to = "codes",
    values_to = "n",
    cols = 5:60
) %>%
select(country, year, codes, n)
```

```

separate()/unite()

```
separate(<DATA>, <VARIABLE>, into = c("<VARIABLE1>", "<VARIABLE2>"))
unite(<DATA>, <VARIABLES>)
```

Use the cases **data below. Separate the** sex_age **column into sex and age columns.**

```
cases <- tribble(
    ~id,    ~sex_age,
    "1",    "male_56",
    "2",    "female_77",
    "3",    "female_49"
)
separate(____, ___, into = c("____", "___"))</pre>
```

```
cases <- tribble(
    ~id,    ~sex_age,
    "1",    "male_56",
    "2",    "female_77",
    "3",    "female_49"
)
separate(cases, sex_age, into = c("sex", "age"))</pre>
```

```
cases <- tribble(</pre>
   ~id, ~sex_age,
   "1", "male_56",
   "2", "female_77",
   "3", "female_49"
separate(cases, sex_age, into = c("sex", "age"))
## # A tibble: 3 × 3
排 id sex age
## <chr> <chr> <chr>
## 1 1 male 56
## 2 2 female 77
## 3 3 female 49
```

```
cases <- tribble(</pre>
   ~id, ~sex_age,
   "1", "male_56",
   "2", "female_77",
   "3", "female_49"
separate(cases, sex_age, into = c("sex", "age"))
## # A tibble: 3 × 3
排 id sex age
排非 <chr> <chr> <chr>
## 1 1 male 56
## 2 2 female 77
## 3 3 female 49
```

```
cases <- tribble(</pre>
   ~id, ~sex_age,
   "1", "male_56",
   "2", "female_77",
   "3", "female 49"
separate(cases, sex_age, into = c("sex", "age"), convert = TRUE)
## # A tibble: 3 × 3
排 id sex age
#非 <chr> <chr> <int>
## 1 1 male 56
## 2 2 female 77
## 3 3 female 49
```

Your Turn 5: Challenge!

There are two CSV files in this folder containing SEER data in breast cancer incidence in white and black women. For both sets of data:

Import the data

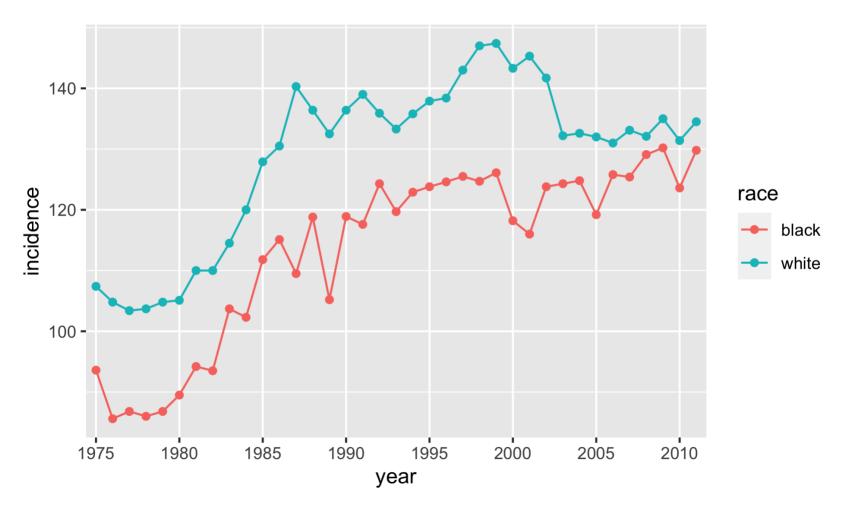

Pivot the columns into 2 new columns called year and incidence

Add a new variable called race. Remember that each data set corresponds to a single race.

Bind the data sets together using bind_rows() from the dplyr package. Either save it as a new object or pipe the result directly into the ggplot2 code.

Plot the data using the code below. Fill in the blanks to have year on the x-axis, incidence on the y-axis, and race as the color aesthetic.

Your Turn 5: No solution **5**

Uncounting frequency tables

```
lotr %>%
  pivot_longer(
    names_to = "sex",
    values_to = "count",
    cols = c(female, male)
) %>%
uncount(count)
```

Uncounting frequency tables

```
