Use pivot_wider() to reorganize table2 into four columns: country, year, cases, and population.

Create a new variable called prevalence that divides cases by population multiplied by 100000.

Pass the data frame to a ggplot. Make a scatter plot with year on the x axis and prevalence on the y axis. Set the color aesthetic (aes()) to country. Use size = 2 for the points. Add a line geom.

table2

排 5 China

#非 6 China

```
table2 %>%
  pivot wider(
    names from = type,
    values_from = count
  ) %>%
  mutate(prevalence = (cases / population) * 100000)
## # A tibble: 6 x 5

separate()/unite()

```
separate(<DATA>, <VARIABLE>, into = c("<VARIABLE1>", "<VARIABLE2>"))
unite(<DATA>, <VARIABLES>)
```

Use the cases **data below. Separate the** sex_age **column into sex and age columns.**

```
cases <- tribble(
    ~id,    ~sex_age,
    "1",    "male_56",
    "2",    "female_77",
    "3",    "female_49"
)
separate(____, ___, into = c("____", "___"))</pre>
```

```
cases <- tribble(
    ~id,    ~sex_age,
    "1",    "male_56",
    "2",    "female_77",
    "3",    "female_49"
)
separate(cases, sex_age, into = c("sex", "age"))</pre>
```

Your Turn 5: Challenge!

There are two CSV files in this folder containing SEER data in breast cancer incidence in white and black women. For both sets of data:

Import the data

Pivot the columns into 2 new columns called year and incidence

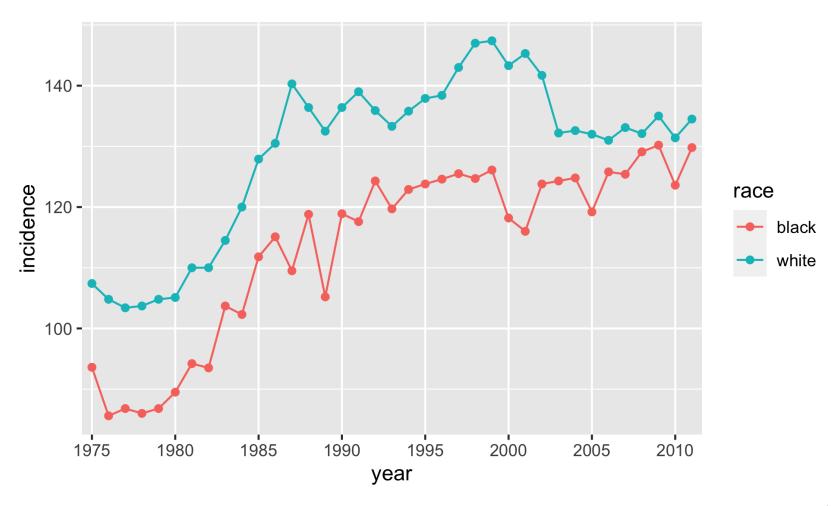

Add a new variable called race. Remember that each data set corresponds to a single race.

Bind the data sets together using bind_rows() from the dplyr package. Either save it as a new object or pipe the result directly into the ggplot2 code.

Plot the data using the code below. Fill in the blanks to have year on the x-axis, incidence on the y-axis, and race as the color aesthetic.

Your Turn 5: No solution 😈

Uncounting frequency tables

```
lotr %>%
  pivot_longer(
    names_to = "sex",
    values_to = "count",
    cols = c(female, male)
) %>%
  uncount(count)
```

Uncounting frequency tables

```
